

Make your research easier to use.

Devin Teichrow, MSc

UCLA-trained epidemiologist working in neurology at UC Irvine; writer and builder behind The Edge of Epidemiology.

I help researchers, labs, health teams, and editors turn technical work into clear writing, useful analysis, and public websites.

Lab Website + Auto Publications	\$650-\$1,500
Research Visibility Package	\$500-\$1,500
Data / Stats / Writing Cleanup Sprint	\$400-\$1,500
Evidence Translation Sprint	\$500-\$1,500
Research Exhibit or Topic Monitor	\$1,000-\$3,000

Define the deliverable / build and review / hand over the work

We agree on the audience, source material, output, scope, and review points. You receive the finished artifact, relevant source files, and instructions for using or updating it.

Maintenance: \$100-\$300/month, separately scoped.

To start, send the problem, audience, existing materials, deadline, and budget range.

01 / \$650-\$1,500

Lab Website + Auto Publications

Your research needs a clear public home, and your publications page needs to stay current.

What you receive

- A responsive lab or project website with people, research, publications, and contact pages.
- A configurable PubMed publication feed, with query rules reviewed for false matches.
- Edited page copy, deployment, and practical update instructions.

To begin: Your current site or draft copy, people and project details, publication identifiers, and any existing visual assets.

Scope: Page count, content readiness, publication-query complexity, and migration needs determine the quote.

Example from my own work: [This publication's static website and searchable archive](#)

02 / \$500-\$1,500

Research Visibility Package

A paper, talk, or project needs a useful explanation for people outside its immediate field.

What you receive

- Plain-language research summaries and project descriptions.
- A scoped set of lab-news, website, or short-form research updates.
- Source-linked copy with qualifications intact and a reusable handoff.

To begin: The papers, slides, recordings, or draft copy; the intended audience; and where the material will appear.

Scope: The number of outputs, source volume, and depth of editorial work determine the quote.

Example from my own work: [The Edge of Epidemiology essay collection](#)

03 / \$400-\$1,500

Data / Stats / Writing Cleanup Sprint

An analysis, figure, codebase, or scientific draft needs to become understandable and reproducible.

What you receive

- A defined R/Python analysis, code-cleanup, figure, or writing deliverable.
- Checks of assumptions, units, denominators, and interpretation relevant to that deliverable.
- A reproducible report or revised artifact with handoff notes.

To begin: A description of the research question, current code or draft, data documentation, and an appropriate shareable sample where needed.

Scope: Data condition, analysis complexity, and the size of the requested revision determine the quote.

Example from my own work: [The timeline's documented records and comparative evidence views](#)

Evidence Translation Sprint

A clinical, public-health, policy, or research question needs a bounded, source-backed answer.

What you receive

- A defined question, search strategy, and inclusion boundaries.
- An evidence table or annotated source packet distinguishing findings from interpretation.
- A brief, memo, or slide-ready summary suited to the audience.

To begin: Your decision or question, audience, existing sources, and any constraints on the review.

Scope: Question breadth, literature volume, source access, and output format determine the quote.

Example from my own work: [Histsearch's curated research dossiers](#)

Research Exhibit or Topic Monitor

A disease, dataset, historical subject, or research program would benefit from an explorable public resource.

What you receive

- A scoped map, timeline, exhibit, reference page, or monitoring interface.
- Accessible record views, source links, and explicit evidence limitations.
- A maintainable static build with documented data and update procedures.

To begin: The topic and intended audience, source material or dataset, desired interactions, and your update needs.

Scope: The number of views, data preparation, custom interactions, and update integration determine the quote.

Example from my own work: [The Maritime Disease Atlas and Pathogen Dispatch](#)
